Specific Research Questions

How are items detected in rare, multi-target & real-world visual search (e.g., baggage screening/radiology)?
What makes one individual a ‘better’ visual searcher than another?
How can specific training regimens enhance visual and attentional abilities?
What is the role of vision and attention in sports, and how can these abilities be enhanced?
How are visual changes detected and what does this tell us about the nature of representations and attention?
In what ways are visual representations similar and different for infants, young adults, and older adults?
