Basics of Logic Design: Finite State Machines

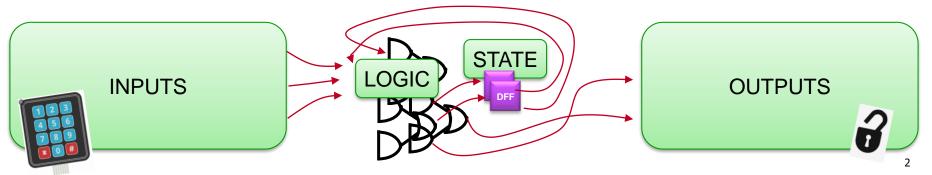

Tyler Bletsch Duke University

Slides are derived from work by Daniel J. Sorin (Duke), Drew Hilton (Duke), Alvy Lebeck (Duke), Amir Roth (Penn)

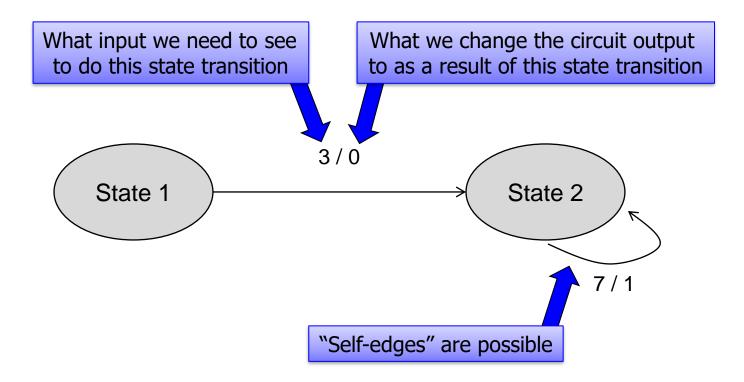

Finite State Machine (FSM)

- FSM = States + Transitions
 - Next state = function (current state, inputs)
 - Outputs = function (current state, inputs)
- What you do depends on what state you're in
 - Think of a calculator ... if you type "+3=", the result depends on what you did before, i.e., the state of the calculator
- Canonical Example: Combination Lock
 - Must enter 3 8 4 to unlock

Preview: the major ingredients to a finite state machine circuit

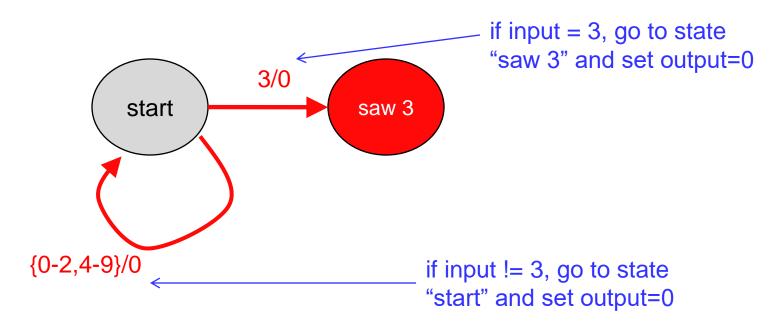

How FSMs are represented

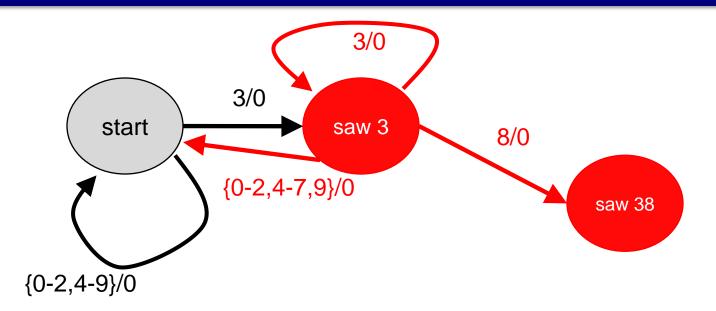

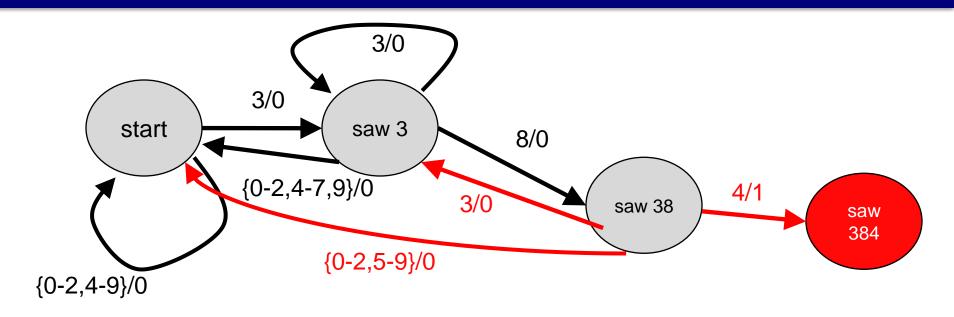

- Combination Lock Example:
 - Need to enter 3 8 4 to unlock
- Initial State called "start": no valid piece of combo seen
 - All FSMs get reset to their start state

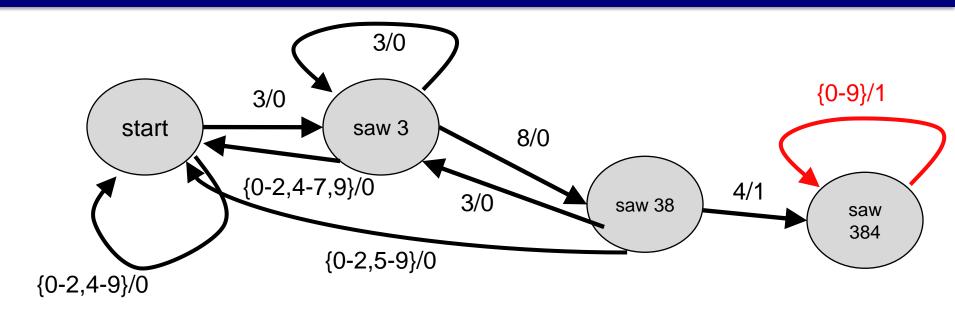

- Combination Lock Example:
 - Need to enter **3** 8 4 to unlock
- Input of 3: transition to new state, output=0
- Any other input: stay in same state, output=0

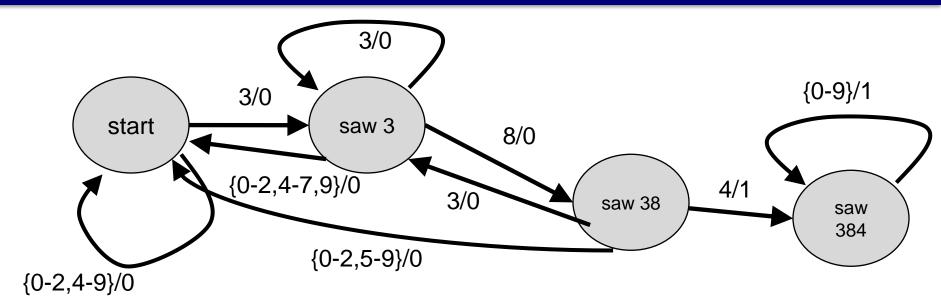

- Combination Lock Example:
 - Need to enter **3 8** 4 to unlock
- If in state "saw 3":
 - Input = 8? Goto state "saw 38" and output=0

- Combination Lock Example:
 - Need to enter **3 8 4** to unlock
- If in state "saw 38":
 - Input = 4? Goto state "saw 384" and set $output=1 \rightarrow Unlock!$

- Combination Lock Example:
 - Need to enter **3 8 4** to unlock
- If in state "saw 384":
 - Stay in this state forever and output=1

In this picture, the circles are states.

The arcs between the states are transitions.

The figure is a state transition diagram, and it's the first thing you make when designing a finite state machine (FSM).

Finite State Machines: Caveats

Do NOT assume all FSMs are like this one!

•A finite state machine (FSM) has at least two states, but can have many, many more. There's nothing sacred about 4 states (as in this example). Design your FSMs to have the appropriate number of states for the problem they're solving.

• Question: how many states would we need to detect sequence 384384?

•Most FSMs don't have state from which they can't escape.

FSM Types: Moore and Mealy

- Recall: FSM = States + Transitions
 - Next state = function (current state, inputs)
 - Outputs = function (current state, inputs)
 - Write the output on the edges
 - This is the most general case
 - Called a "Mealy Machine"
 - We will assume Mealy Machines in this lecture
- A more restrictive FSM type is a "Moore Machine"
 - Next state = function (current state, inputs)
 - Outputs = function (current state)
 - Write the output in the states
 - More often seen in software implementations

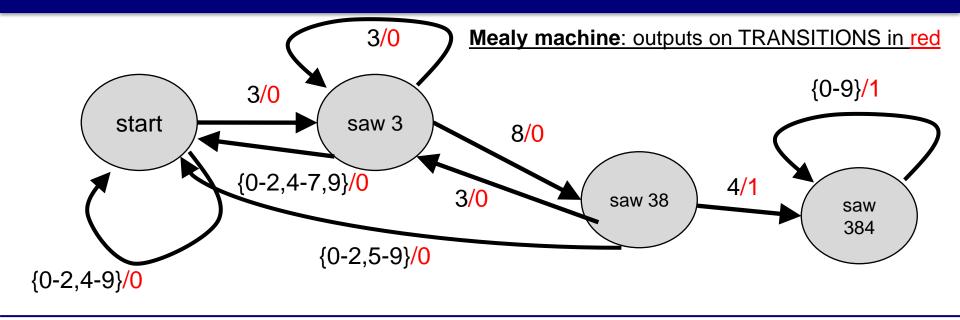

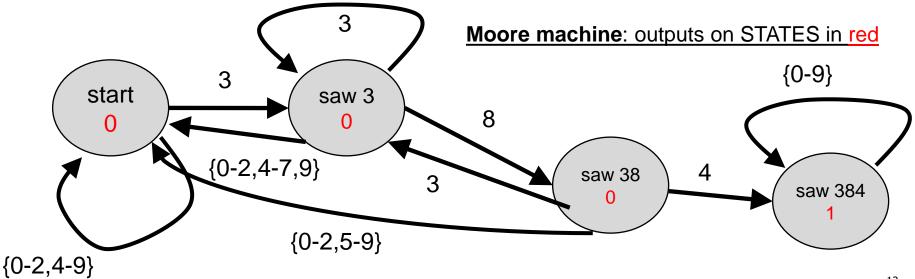

"Mealy Machine" developed in 1955 by George H. Mealy

"Moore Machine" developed in 1956 by Edward F. Moore

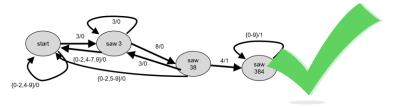

Mealy vs Moore

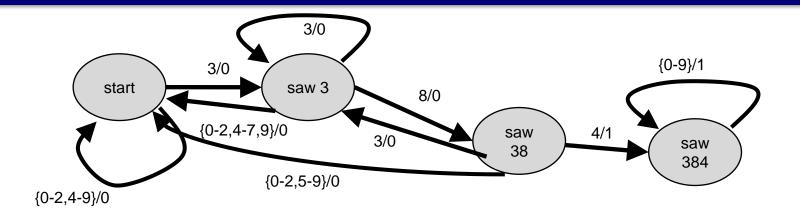

FSM Design Process

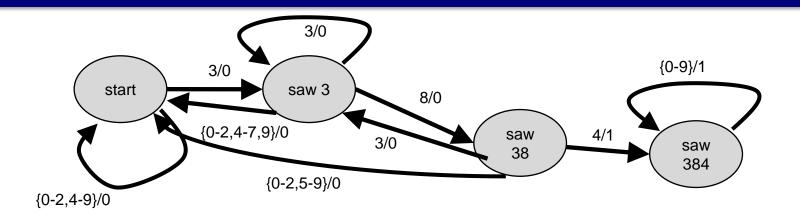

- Systematic approach that always works:
 - 1. Start with state transition diagram

- 2. Make truth table
- 3. Write out sum-of-products logic equations
- 4. Optimize logic equations (optional)
- 5. Implement logic in circuit

Current State	Input	Next state	Output
Start	3	Saw 3	0 (closed)
Start	Not 3	Start	0
Saw 3	8	Saw 38	0
Saw 3	3	Saw 3	0
Saw 3	Not 8 or 3	Start	0
Saw 38	4	Saw 384	1 (open)
Saw 38	3	Saw 3	0
Saw 38	Not 4 or 3	Start	0
Saw 384	Any	Saw 384	1

Digital logic \rightarrow must represent everything in binary, including state names. But mapping is arbitrary!

```
We'll use this mapping:

start = 00

saw 3 = 01

saw 38 = 10

saw 384 = 11
```

Current State	Input	Next state	Output
00 (start)	3	01	0 (closed)
00	Not 3	00	0
01	8	10	0
01	3	01	0
01	Not 8 or 3	00	0
10	4	11	1 (open)
10	3	01	0
10	Not 4 or 3	00	0
11	Any	11	1

4 states \rightarrow 2 flip-flops to hold the current state of the FSM inputs to flip-flops are D₁D₀ outputs of flip-flops are Q₁Q₀

Current State = Q 's			Next Sta	Next State = D 's		
Q1	Q0	Input	D1	D0	Output	
0	0	3	0	1	0 (closed)	
0	0	Not 3	0	0	0	
0	1	8	1	0	0	
0	1	3	0	1	0	
0	1	Not 8 or 3	0	0	0	
1	0	4	1	1	1 (open)	
1	0	3	0	1	0	
1	0	Not 4 or 3	0	0	0	
1	1	Any	1	1	1	

Input can be 0-9 \rightarrow requires 4 bits input bits are in3, in2, in1, in0

Q1	Q0	Input	D1	D0	Output
0	0	3	0	1	0 (closed)
0	0	Not 3	0	0	0
0	1	8	1	0	0
0	1	3	0	1	0
0	1	Not 8 or 3	0	0	0
1	0	4	1	1	1 (open)
1	0	3	0	1	0
1	0	Not 4 or 3	0	0	0
1	1	Any	1	1	1

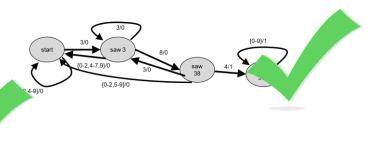

Now let's transform the **inputs**.

	Same inputs as before, now just in binary							
Q1	Q0	In3	In2	In1	In0	D1	D0	Output
0	0	0	0	1	1	0	1	0
0	0			Not 3		0	0	0
			(all binary com	bos other than	0011)			
0	1	1	0	0	0	1	0	0
0	1	0	0	1	1	0	1	0
0	1			ot 8 or 3		0	0	0
		(all	binary combos	other than 100	0 & 0011)			
1	0	0	1	0	0	1	1	1
1	0	0	0	1	1	0	1	0
1	0		Not 4 or 3					0
		(all	(all binary combos other than 0100 & 0011)					
1	1		Any 1					1

From here, it's just like combinational logic design! Write out product-of-sums equations, optimize, and build.

FSM Design Process

- Systematic approach that always works:
 - 1. Start with state transition diagram
 - 2. Make truth table

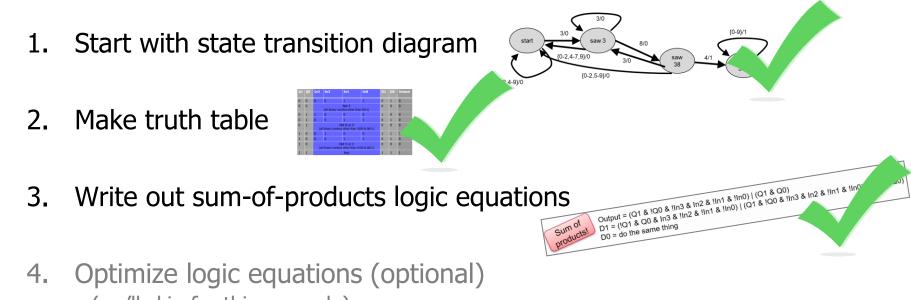

- 3. Write out sum-of-products logic equations
- 4. Optimize logic equations (optional) (we'll skip for this example)
- 5. Implement logic in circuit

Q1	Q0	In3	In2	In1	In0	D1	D0	Output
0	0	0	0	1	1	0	1	0
0	0		(all binary com	Not 3 bos other than	0011)	0	0	0
0	1	1	0	0	0	1	0	0
0	1	0	0	1	1	0	1	0
0	1	(all	No binary combos	ot 8 or 3 other than 100	0 & 0011)	0	0	0
1	0	0	1	0	0	1	1	1
1	0	0	0	1	1	0	1	0
1	0	(all	Not 4 or 3 (all binary combos other than 0100 & 0011) 0 0 0					
1	1	Any 1 1						1
Output = (Q1 & !Q0 & !In3 & In2 & !In1 & !In0) (Q1 & Q0) D1 = (!Q1 & Q0 & In3 & !In2 & !In1 & !In0) (Q1 & !Q0 & !In3 & In2 & !In1 & !In0) (Q1 & Q0) D0 = do the same thing								

FSM Design Process

• Systematic approach that always works:

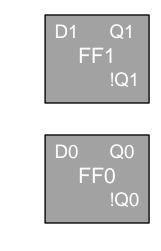

- (we'll skip for this example)
- 5. Implement logic in circuit

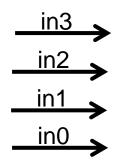

Q1	Q0	In3	In2	In1	In0	D1	DO	Output
0	0	0	0	1	1	0	1	0
0	0			Not 3		0	0	0
0	1	1	0	0	0	1	0	0
0	1	0	0	1	1	0	1	0
0	1		Not 8 or 3					0
1	0	0	1	0	0	1	1	1
1	0	0	0	1	1	0	1	0
1	0	Not 4 or 3					0	0
1	1	Any				1	1	1
	γ)						γ]	

Remember, these represent **DFF outputs**

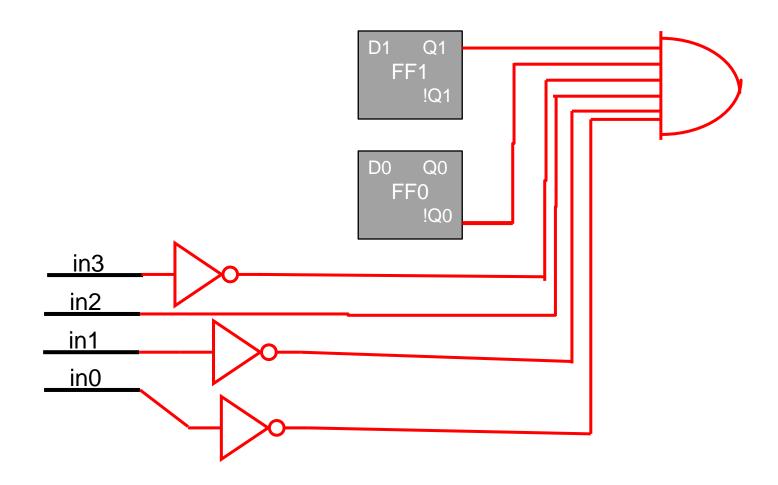

...and these are the DFF inputs

The DFFs are how we store the **state**.

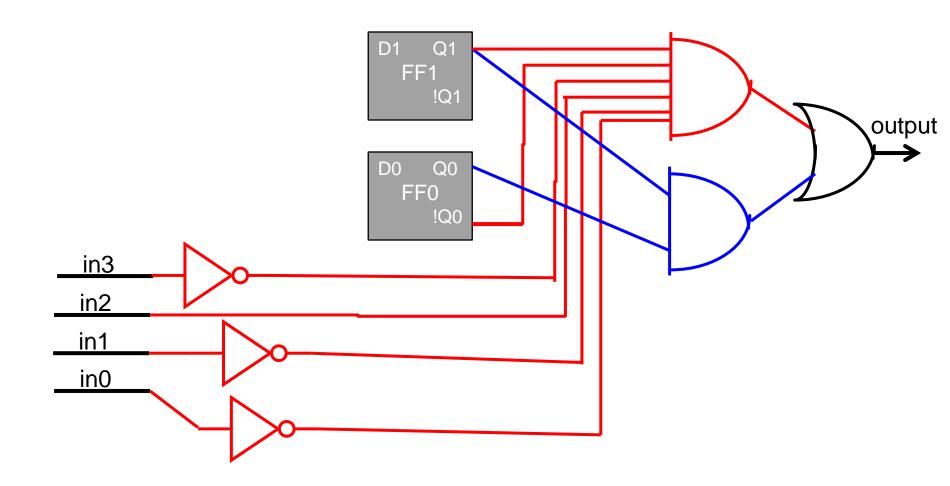

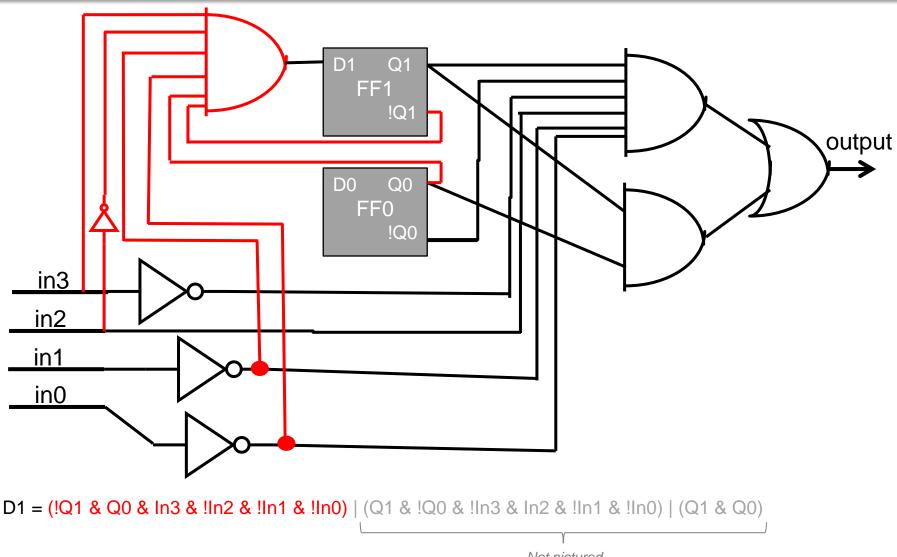

Start with 2 FFs and 4 input bits. FFs hold current state of FSM. (not showing clock/enable inputs on flip flops)

output = (Q1 & !Q0 & !In3 & In2 & !In1 & !In0) | (Q1 & Q0)

output = (Q1 & !Q0 & !In3 & In2 & !In1 & !In0) | (Q1 & Q0)

Follow a similar procedure for D0...

Not pictured

FSM Design Process

- Systematic approach that always works:
 - Start with state transition diagram 1. 1.2 4.7 91 {0-2,5-9}/0 Make truth table 2. Output = (Q1 & IQ0 & IIn3 & In2 & IIn1 & IIn0) | (Q1 & Q0) D1 = (IQ1 & Q0 & In3 & IIn2 & IIn1 & IIn0) | (Q1 & IQ0 & IIn3 & In2 & IIn1 & IIn0) Write out sum-of-products logic equations 3. D0 = do the same thing Optimize logic equations (optional) 4. (we'll skip for this example) We did it! Stock photo guy is happy! Implement logic in circuit 5.

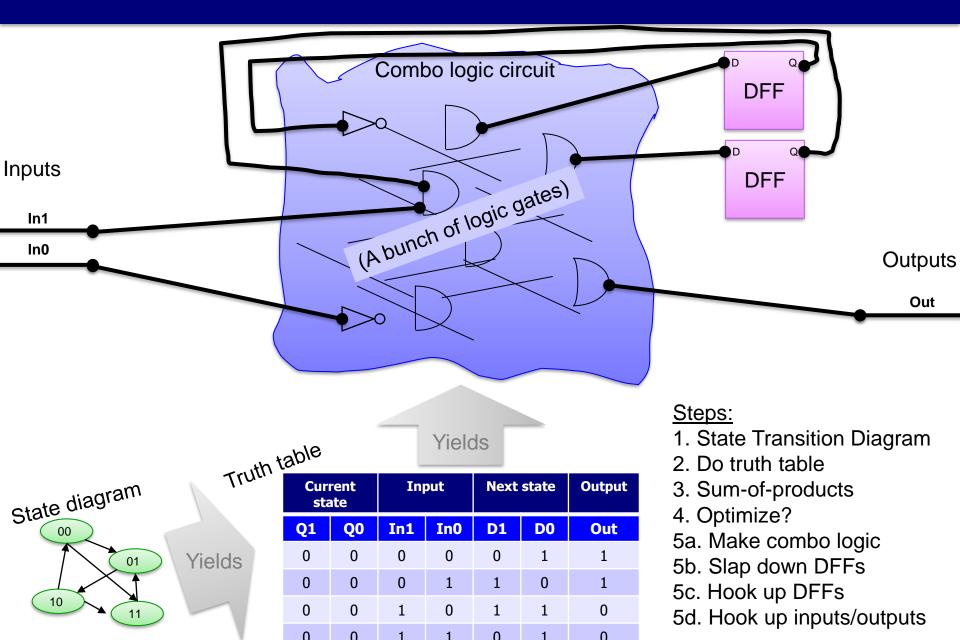

FSM tips

- Sometimes can do something non-systematic
 - Requires cleverness, but tough to do in general
- Do not do any of the following!
 - Use clock as an input (D input of FF)
 - Have multiple clocks
 - Perform logic on clock signal

(except maybe a NOT gate to go from rising to falling edge triggered)

• Let's review the FSM Design Process one more time, this time with animation...

FSM Design Process, animated
